GLOSSARY OF TERMS

Abbreviation	Term	
CEP	Customer Engagement Plan	
CRMS	Control Room Management System	
C ₂ C	Capacity to Customers	
DPS	Data Protection Statement	
I&C	Industrial & Commercial	
MPAN	Meter Point Administration Number	
SDRC	Successful Delivery Reward Criteria	
SDRC output	Discrete evidence of attainment or part attainment of an SDRC as defined in the Project Direction	
RTU	Remote Terminal Unit	
NMS	Network Management System	
GE PoF	GE PowerOn Fusion Network Managemen System	
GSM	Global System for Mobile Communication (GSM)	

All other definitions shown starting with a capital letter are as per Low Carbon Networks Fund Governance Document v.6

1 EXECUTIVE SUMARY

The C₂C Project was authorised to commence in January 2012 and is due to complete in December 2014. The aim of the Project is to test new technology, network operational practices (ie closed HV rings), the customer experience of being connected to a closed ring and commercial demand response contracts that will allow Electricity North West to increase the loadings on a selection of Trial circuits representing approximately 10% of our HV network without resorting to conventional network reinforcement. In other words to 'release' inherent spare capacity in the HV system in order to accommodate the future forecast increases in demand whilst avoiding (or deferring) the cost and environmental impacts that are associated with traditional network reinforcement. The Project consists of customer and commercial; technology; and learning and dissemination Workstreams.

The Project has developed and is now trialling new demand response contracts that will allow Electricity North West to manage the import or export capacity of either existing or new connections customers on the Trial circuits under fault or abnormal system conditions. Existing customers are receiving regular monthly payments in exchange for the managed contract, whereas new connections customers are being offered the option to sign up to a connection contract with demand response obligations in exchange for a reduced connection / reinforcement charge.

In the event that a fault occurs on or adjacent to the HV network feeding such a customer, the contract will allow Electricity North West to manage all or part of their import or export capacity, if required by the network, to enable Electricity North West to restore customers' supplies in as short a time as possible. It is envisaged that many future customers may opt for part of their demand to be managed in this manner in exchange for reduced connection charges.

The Project commenced the live Trial phase in April 2013 and this will continue until September 2014. There has been considerable customer engagement throughout the Project both in preparation for Trial go-live and since go-live. This will continue throughout the Trial period.

The Project actual costs to date are £7.6m and the estimated at completion costs is now £8.7m, which is £1.5m favourable to Project Budget (including contingency).

Progress to date

This report is the fifth Project Progress Report and covers the period December 2013 to May 2014 inclusive. The Project is on track and key highlights to date are;

Ongoing customer engagement element of the project is progressing well.

- We have performed 23 post fault customer surveys on C₂C circuits and early findings support the hypothesis that customers experience/perceive a shorter restoration time.
- We have also performed 11 surveys of customers who have either accepted or rejected a C₂C contract in order to enhance our understanding of the motives and barriers to takeup.

The above interviews will continue throughout the trial to allow for qualitative analysis to be undertaken. An overview of current findings can be found in the lessons learned section of this report.

We will continue to monitor and sample survey customers connected to the trial circuits to measure their perception of power quality/reliability of being connected to a trial circuit. We will also compare the perceptions of those customers on trial circuits (test group) to those that are not (control group).

Recruitment of new connections customers has been challenging

This element of the project has been adversely affected by the economic downturn resulting in lower overall system demand and hence fewer qualifying applications requiring reinforcement. This situation has been exacerbated by other LCNF work which has progressed into BAU increasing existing network capacity. As a consequence we have been able to offer fewer C₂C managed connection agreements than originally envisage to new connections customers as these only benefit customers when reinforcement is required.

We have currently signed one new connection contract and have 13 new connection opportunities that we are pursuing. We are continuously monitoring this element of the project. However, with four months of the Trial remaining given the present economic conditions it is difficult to predict if the target of ten contracts will be achieved. We are considering if it will be necessary to extend the Trial beyond the current end date of September 2014. This would involve extending the software licences and support for the GE PowerOn Fusion product and maintaining the commercial Workstream resources. Both of these activities are currently outperforming budget and it is therefore likely that such an extension, if it were required, could be funded without exceeding the Project Budget. At this stage we are not requesting any such extension and we will closely monitor progress regarding new customer contracts.

Recruitment of existing customers is complete

- We have achieved our SDRC relating to purchasing a minimum of ten existing customer contracts.
- We have purchased 10 contracts and generated learning using two of the three routes to market, namely direct and via an agent. Any remaining contracts we purchase will be via Flexitricity ie the third and final route to market.
- During the current reporting period we have conducted a proof of concept Trial aimed at demonstrating a low cost method of a DNO initiating a trip of a circuit breaker controlled by an aggregator. This is essential to enable the third route to market, namely contracts purchased via an aggregator.

During the reporting period the Project has delivered six SDRC outputs, these are detailed below and in section 5.

Academic Research is progressing well

Apart from the technical requirements associated in deploying C_2C , the economic perspective of the C_2C solution needs to be understood. In this respect, The University of Manchester is conducting an economic benefits analysis to investigate whether or not the C_2C method or combinations of underlying solutions are economically sound, as well as understanding the key factors that engender or constrain value creation.

A deterministic scenario and optimisation based framework consistent with Ofgems' RIIO-ED1 CBA has been developed, it can identify optimal asset build strategies that may recommend implementing traditional reinforcements and C_2C interventions independently (ie, a reinforcement can be avoided via a C_2C intervention) or in combination (ie, some benefits can be gained by implementing both C_2C and reinforcement solutions). In addition, it will highlight the conditions that increase or decrease the economic attractiveness of the C_2C method.

The results of the preliminary analyses conducted for different scenarios indicate that the C_2C method can be a cost effective alternative to traditional reinforcement practices as it can result in significant investment and social costs reductions.

In order to properly capture the value associated with the C_2C solution, the framework will be furthered extended to consider (i) uncertainties associated with possible futures; (ii) including all the relevant components that can play a role in a CBA from different perspectives; (iii)

quantifying the costs and benefits of different competing options on a like for like basis, possibly taking into account available optimisation engines.

The University of Strathclyde is conducting detailed analysis and quantification of the technical effects of C_2C operation namely inherent network capacity, electrical losses and power quality. This work is based on simulation studies and on actual data from the live trial system.

The analysis method involves combining network data from a variety of sources to produce detailed models which represent the circuits involved in the trial.

Tyndall Centre for Climate Change Research at the University of Manchester is conducting studies to understand the carbon impacts of the C₂C project.

The approach is similar to that used by the Kyoto Protocols' Clean Development Mechanism. A baseline scenario has been constructed to represent business as usual capacity release through traditional reinforcement. A Life Cycle Assessment (LCA) will be performed for the assets used in the network reinforcement, totalling the greenhouse emissions embodied in their manufacture, transport, installation and disposal. The carbon impact from the assets and the operations of the network under the C_2C configuration will then be compared to this baseline and summed across defined time periods.

Table 1.1 Most significant SDRC delivered during the reporting period

Milestone	Workstream	Completion date
Submit project progress report number four to Ofgem	Dissemination	Dec-13
Publication of white paper number four	Dissemination	Dec-13
Publication of trade magazine article number nine	Dissemination	Jan-14
Publication of trade magazine article number ten	Dissemination	Mar-14
Network data available to stakeholders	Dissemination	Apr -14
Customer seminar number five (Connections applicants/ agents)	Dissemination	Apr-14

During the next reporting period the Project will seek to complete negotiations of at least ten post-fault demand response contracts with new customers, continuously monitor and model the effect of changes to the network running configuration, monitor any subsequent effects on Trial participants and customers connected to Trial circuits and continue to disseminate learning on an ongoing basis.

Summary of key risks

There is one risk associated with the achievement of a Project SDRC or maintaining consistency with the Full Submission. This risk is summarised below and described in detail in section four of this report.

Risk description	Category
Low economic activity and reduced system maximum demand may affect participation for new connections customers.	Recruitment

Summary of key learning outcomes delivered in the period

A detailed description of the Projects' learning outcomes can be found in section 6, the areas where learning has emerged are summarised below:

- Engagement with customers.
- Working with aggregators Controlling aggregators' equipment.
- Purchasing DSR from new connection/ additional load customers.
- Analysing the effect of C₂C on the network.
- Accommodating DSR in ER P2-6.

Third Party dissemination activities

Event	Contribution	Date
UoS – 'Analysis and Quantification of the benefits of interconnected distribution system operation' APAP 2014, South Korea	Submitted	Dec 2013

Various electronic newsletters	Published	Various
National Grid demand customer seminar	Attended	May 2014

Internal dissemination activities

- Briefings to Connections business' system planners/ designers.
- Briefings and training to system planners regarding production of C₂C design and quotations.
- Company-wide briefings via our intranet and internal Newswire magazine.

2 PROJECT MANAGERS' REPORT

2.1 General Project Management

The most significant Project management activities undertaken during the reporting period are listed below:

- Management of Project resources.
- Project monitoring and control.
- Internal and external stakeholder awareness.

During this reporting period the Project emphasis has continued to focus on Trial implementation. The key activities of the Project team have been purchase of connection managed agreements, customer engagement, data collections and analysis. Continuous internal stakeholder engagement has taken place in order to embed the Trial processes and obtain feedback from those involved. This process will continue as the Trial progresses as and when learning is generated that requires internal communication.

During the next reporting period significant Project management activities will be:

- Continued stakeholder engagement and management.
- Continued project monitoring and control.
- Preparation for Project closedown.

There are no Project management risks or issues that are associated with delivery of a Project SDRC or maintaining consistency with the Full Submission.

2.2 Technology Workstream

The most significant Technology Workstream activities during the reporting period are listed below:

- Installation of remote control devices at Trial participants' premises.
- Management of data retrieved from Trial networks.
- Continued work with University Partners to commence losses, power quality, carbon and economic benefit analysis work with the Universities of Manchester & Strathclyde

All SDRC that are associated with the above activities are complete or on track.

During the next reporting period, the Technology Workstreams' significant activities will be:

- Completion of losses, power quality, carbon and economic benefit analysis work with the academic Partners.
- Installation of remote control equipment at customers' premises and other locations as appropriate as and when Trial participants are secured.

There are no Technical Workstream risks or issues that are associated with delivery of a Project SDRC or maintaining consistency with the Full Submission.

2.3 Customer and Commercial Workstream

The most significant Customer and Commercial Workstream activities during the reporting period are listed below:

- Continued engagement with existing I&C customers.
- Continued direct engagement with new I&C demand and generator customers to secure new connections Trial participants.
- Customer seminars and briefings.

 Ongoing power quality monitoring customer surveys throughout the Trial to obtain feedback from customers connected to Trial circuits (test group) and customers not on trial circuits (control group) to allow for comparisons to be made.

With the exception of engagement with new demand or generation customers all SDRC that are associated with the above activities are complete or on track. As stated in the executive summary the activity of securing ten managed connection agreements has been affected by low economic activity and reduced system maximum demand due to a continuation of the economic recession in the North West region. This risk is described in full in section four of this document.

During the next reporting period the Customer and Commercial Workstreams' significant activities will be:

- Continued engagement with existing I&C customers.
- Continued direct engagement with new I&C demand and generator customers to secure new connections Trial participants.
- Customer seminars and briefings.
- Ongoing power quality monitoring customer surveys throughout Trial to obtain feedback from Trial participants and domestic customers connected to Trial circuits.

There is one Commercial risk associated with the achievement of a Project SDRC or maintaining consistency with the Full Submission. These risks are summarised below and described in detail in section 4 of this report.

Risk description	Category
Low economic activity and reduced system maximum demand may affect participation for new connections customers.	Recruitment

3 CONSISTENCY WITH FULL SUBMISSION

During the previous reporting period Ofgem approved a change request associated with the project under clause 3.101 of the Low Carbon Networks Fund Governance Document v.6. This change was in relation to the involvement of Enernoc (one of our aggregator Partners). Enernoc declined to participate in the tender exercise that was undertaken in order to agree the recruitment processes and the costs for Partners to purchase C_2C demand response from our existing customer base. The contract to procure up to ten C_2C agreements from existing customers was subsequently awarded to npower. With the exception of the above change the Project is being undertaken in accordance with the Full Submission.

4 RISK MANAGEMENT

4.1 Risks and issues experienced during reporting period

Recruitment Risks

There is currently one recruitment risks that are associated with the achievement of the Project SDRCs or maintaining consistency with the Full Submission.

Low economic activity and reduced system maximum demand may affect participation for new connections customers (R023) - Status: Open – Likelihood: Moderate, Impact: Significant

Risk: There is a risk that we may not secure ten demand response contracts with new customers, leading to failure to achieve a Project SDRC, because of lower than anticipated economic activity and reduced system maximum demand in the North West region.

Action plan:

We have performed a number of actions to mitigate this risk. The first proactive action was taken during Trial circuit selection activity where connections market activity was a key criterion for assessing suitability of the circuit for inclusion in the Trial. Since December 2012 we have increased engagement with developers to reinforce and cement awareness of the opportunities that may exist to obtain lower cost connection quotations. We have been closely monitoring new connections applications on the C_2C circuits. In addition to this we have also performed a number of other actions such as:

- 1. Review of all non C₂C applications that have expired or are about to expire. There may be opportunities to re-design and re-quote based on the C₂C design principles to customers who have not accepted on the basis of the original quote being too high.
- 2. Review of all accepted 'non C₂C quotations' that have gone into construction but not yet started on site. Some of these may be eligible for and benefit from being redesigned and re-quoted based on the C₂C design principles. In all cases this would be by agreement with the customer. And subject to an eligibility test (ie in the trial area).

To date we have currently signed one new C_2C connection contract. We currently have 146 applications that are 'on or near' a trial circuit. However, due to the reduction in system maximum demand and other LCNF work that has progressed to BAU only 13 of these require a circuit to be reinforced such that a lower cost C_2C quote can be offered to the customer.

The table below shows the decrease in maximum demand associated with the Trial circuits from 2010/11 onwards. This demonstrates a reduction of approximately 6.6% since the creation of the project Full Submission.

	2010/11	2011/12	2012/13
MD all C2C Primary Substations	2,049.39	1,954.02	1,923.11
% change from 20010/11	0.0%	-4.9%	-6.6%

During the current period we have presented 12 customers with C_2C options, we would categorise six as being 'likely to sign'. However, a further challenge we face is that despite a connections offer being made, the customer may not be in a position to accept within the timescales that align to the Trial end date.

Summary

The economic recession has resulted in a general decline in demand that has resulted in a 6.6% reduction in maximum demand on the Trial circuits since the Full Submission was prepared. To put this in context, on a 7.5MVA rated 11kV circuit this could equate to 450kVA additional available capacity. When combined to form a ring, this could result in possibly two connections being made to the network without the need for reinforcement that at the time of producing the Full Submission would have triggered reinforcement. Considering there are over 150 closed rings involved in the Trial, this means that over 300 new connection offers could now be made without the need for reinforcement that, based on 2010 demand, would have triggered reinforcement.

We are optimistic that a number of the applications that are currently eligible will be converted into accepted C₂C new connections agreements. We have also generated extremely useful learning and dissemination material from this activity despite the number of contracts signed. Interim lessons learned from this activity are detailed in section six and a full analysis will be included in the Project Closedown Report in December 2014.

Procurement, Installation and Other

Risks

There are currently no Procurement, Installation or Other risks that affect our ability to deliver the Project as described in the Full Submission.

4.2 Risks that existed at time of documenting the Project Full Submission

The narrative below refers to risks that existed at time of submission and were detailed in Appendix 2 of the Full Submission.

Recruitment Risks

No recruitment risks were detailed in Appendix 2 of the Full Submission.

Procurement Risks

Risk 8 - Project Partners walk away once Project is won - Status: Controlled

We have signed contracts with GE Energy, PB Power, npower and our University Partners who are all are actively engaged in the Project. As described in section three of this report, Enernoc has declined to actively participate in the purchase of C₂C DSR agreements for strategic commercial reasons. We continue to work with our Partners in order to complete their work packages and prepare learning and dissemination material for Project Closedown.

Installation Risks

Risk 1: Risk that internal Operations team will not be able to support installation of automated devices - Status: Controlled

The majority of installation work has now been completed. The only installation work remaining is the installation of equipment at Trial customers' premises as and when they sign contracts. Our Technology Workstream is liaising directly with the installation resource and no issues are foreseen over the remainder of the Project.

Risk 6 - Network equipment cost overruns - Status: Controlled

This activity has been completed within budget.

Other Risks

Risk 2: Risk that key personnel will not be available to deliver the Project - Status: Controlled

The Project delivery team has been recruited and are part of the same department as the bid development team, which supported the delivery team during the mobilisation stage of the Project. The Project is now past its most intensive period and is sufficiently resourced to deliver the remainder of the Project.

Risk 3: Risk of problems with the financial control of the Project because of the new requirement for a separate bank account - Status: Controlled

The Project Bank Account has been set up and monthly processes have been put in place to review receipt and payments on a monthly basis.

Risk 4: Failure to achieve low carbon saving - Status: Open – Likelihood: Moderate, Impact: Significant

This aspect of the Project is being investigated by our Partner, Tyndall Centre (for Climate Change) at University of Manchester. Their approach is similar to that used by the Kyoto Protocols' Clean Development Mechanism. A baseline scenario has been constructed to represent business as usual capacity release through traditional reinforcement. A Life Cycle Assessment (LCA) will be performed for the assets used in the network reinforcement, totalling the greenhouse emissions embodied in their manufacture, transport, installation and disposal. The carbon impact from the assets and the operations of the network under the C_2C configuration will then be compared to this baseline and summed across defined time periods.

Action plan: Complete analysis and publish findings via standalone publications and through Project learning and dissemination materials.

Risk 5: Poor Project management - Status: Controlled

The Project team has been recruited. The Project manager is a member of the Project Management Institute and holds Professional Project Manager credentials (PMP). Weekly and monthly Project governance meeting have been established and implemented. These include monthly updates to the sponsoring director.

Risk 7 – Payment to customer cost overruns - Status: Controlled – Likelihood: Moderate, Impact: Low

This risk is now controlled. We have now purchased the minimum of ten agreements with existing customers within the Project Budget of £300k. Five agreements have been purchased directly and five via nower acting as our agent.

5 SUCCESSFUL DELIVERY REWARD CRITERIA

During the reporting period, six planned SDRC were delivered. These are detailed in table 5.1 below.

Table 5.1 SDRC delivered in reporting period

Milestone	Planned date	Completion date	Comments
Submit project progress report number four to Ofgem	Dec-13	Dec-13	Completed
Publication of white paper number four	Dec-13	Dec-13	Completed
Publication of trade magazine article number nine	Jan-14	Jan-14	Completed
Publication of trade magazine article number ten	Mar-14	Mar-14	Completed
Network data available to stakeholders	Apr -14	Apr -14	Completed
Customer seminar number five (Connections applicants/ agents)	Apr-14	Apr-14	Completed

The SDRC planned for the next reporting period can be seen in table 5.2 below.

Table 5.2 SDRC look ahead

Milestone	Planned date	Forecast date	Comments
Submit project progress report number five to Ofgem	Jun-14	Jun-14	On track
Publication of white paper number five	Jun-14	Jun-14	On track
C ₂ C managed connections contracts in place	Sep-14	Sep-14	On track
Present to industry conference number five (Electricity North West knowledge sharing event)	Dec-14	Nov-14	On track
Present to LCN Fund Annual Conference by 2014	Dec-14	Oct-14	On track
Demand response capability test completed	Dec-14	Dec-14	On track
Publication of white paper number six	Dec-14	Dec-14	On track
Closedown report submitted to Ofgem	Dec-14	Dec-14	On track

During the next reporting period none of the SDRCs are forecast to be delivered at variance to the planned dates contained within the Project plan appended to the Full Submission.

6 LEARNING OUTCOMES

We have established a Project website which is used as a repository for sharing Project learning to interested stakeholders. The learning outcomes during the period are described below.

Lesson 1: Engagement with customers (Power Quality Monitoring initial findings)

Background: Now that the Trial is live surveys are being conducted to monitor the effects of the Trial on customers in three areas:

- 1. Measuring customer perceptions of their power quality and reliability ie fault frequency, duration, dips and spikes throughout the trial period.
- 2. Comparing the perceptions of those customers who are not on C₂C circuits (control) to those that are (test).
- 3. Comparing the perceptions of both test and control customers to reality by comparing customer survey data with actual fault frequency and duration.

So far 429 interviews have been completed, predominantly with domestic customers. The results of these surveys have been weighted to ensure that the control and test groups have a matched customer profile allowing comparisons to be made.

Lessons learned

- 1. Equal proportions of all customers in Trial areas and non-trial areas perceived fewer faults since the C₂C trial began in April 2013 (12% v 13% of respondents).
- 2. Equal proportions of customers in Trial areas and non-trial areas perceived fewer dips or spikes in their supply compared to non-trial areas (5% v 7% of respondents).

- 3. Twice as many domestic customers in non-trial areas said that the frequency of faults had increased (4% trial v 8% non-trial) and an equal proportion said they had decreased (11% v 13%).
- 4. Power quality amongst domestic customers in trial areas who have not experienced any faults has improved for both frequency (net improvement of 8%) and dips and spikes (net 2%) which are both better than observations amongst domestic customers on non-trial circuits (5% and -3& respectively).

Further comments

These findings suggest that for trial customers, the introduction of C_2C improves perceptions of their experience of faults. Faults under C_2C conditions are sometimes difficult for customers to detect given that nearly half of customers who said they experienced a fault actually did not. It could be that what customers are detecting are actually dips and spikes rather than faults. The ongoing power quality monitoring survey will be repeated in August 2014 before the trial is completed to allow for further quantitative analysis to be undertaken.

Lesson 2: Working with aggregators – Utilising aggregators equipment

Background: In order for DNOs to use aggregators to despatch load under fault conditions it has been necessary to develop a low cost solution to initiate a demand response using the aggregators' equipment. The original planning assumption was that a communication would take place between the Electricity North West control system and the aggregator control engineer who would then initiate the demand response. As the technical solution developed it became clear that the control/ operation of all load control equipment needs to take place within the dead time immediately after a fault so that the restoration process can commence in order to restore supplies via our automatic restoration system without delay.

In order to develop a solution that met the technical requirements an alternative concept trial has been conducted at a C_2C Trial participant's site.

Lessons learned

- In order to ensure operation of the load control device within the required time period ie 180 seconds, it would have been necessary to establish a direct connection between the Electricity North West Control system and the aggregators' IT system. This proposed solution was discounted on the basis that it may have compromised the integrity of the Electricity North West control system.
- The second proposed solution was to use the Electricity North West control system to send a voice message to the aggregator control room with an instruction to disconnect the load. This option was discounted because it was not possible to achieve the required demand response timescales.
- The requirement for the aggregators' control room staff to have adequate training and operational authorisation to operate a DNO HV switch was also considered but it was decided that utilising an aggregators' outstation to control a DNO switch was not feasible.

The trial involves controlling the load using a standard Electricity North West solution of an RTU connected to an actuator which would be controlled via the standard automation software. However, in order to prove the alternative concept of using an aggregators control system Electricity North West and Flexitricity worked together in order to develop a solution that involved a discrete connection between the Electricity North West RTU and the Flexitricity outstation. This provides a low cost secure means of operating a switch controlled by an aggregators' outstation with the trip signal being initiated by the DNO control system. The solution also provides circuit state indication to the aggregator control room so that both control engineers are aware of the status of the load control device.

Further comments

This alternative concept trial has been conducted on a C₂C Trial participant's site and involved a customer that had been signed directly by Electricity North West and whose load control device was controlled by an Electricity North West RTU. The trial has proved that Electricity North West and aggregator equipment can be co-located at a customers' premise and that an aggregator's load control device could be controlled via the DNO RTU sending a trip signal to the aggregator outstation.

Lesson 3: Purchasing DSR from new connection/ additional load customers

Background:

Section 9.7 of the Full Submission document committed to enter into managed agreements with demand and/or generation customers or their agents, at least ten of which from connections customers during the trial period from April 2013 to September 2014.

To achieve this it was planned to support the existing connections business with dedicated C_2C connections resource in order to manage the marketing, customer engagement and customer relations with new I&C customers and developers seeking connection to a HV or EHV trial circuit. The C_2C solution would mitigate the requirement to reinforce the network (as per standard design), however the restoration of the customer's supply may be managed during a fault event.

The C_2C connections team have reviewed 620 applications from I&C and generator customers whose site was on/near a trial circuit. From these, 67 applications have required reinforcement (or connected to an alternative circuit to avoid the requirement to reinforce the network).

To date we have offered managed agreements to 12 customers, one has accepted, four declined the C_2C offer, and seven of are still considering their offers.

As highlighted in chapter four there has been a lower than anticipated number of opportunities throughout the Trial period, this is due to a reduction in the maximum demand of the primary transformers supplying the trial circuits of 6.6%, from 2009 to 2013. To put this in context, this could equate to 300kVA to 495kVA additional available capacity per HV circuit depending on circuit voltage. When combined to form a ring, this could result in possibly two connections being made to the network without the need for reinforcement that previously would have triggered reinforcement. Considering there are over 150 closed rings on the trial, this means that approximately 150¹ connections offers could now be made without the need for reinforcement that, based on 2010 demand would have triggered reinforcement.

Lessons learned

1. Customer negotiations - getting to speak to the decision makers - Though we were aware that the managed agreement had to be entered into by the end user, we did not fully anticipate the complexity of the work involved in articulating the C₂C proposition to the key decision makers within the end user organisation. We now know that in most cases the original requester does not have the decision making powers to accept the C₂C connection and that we need to be present the C₂C concept and the proposed C₂C connection arrangements several times as the connection offer rises through the organisation to the key decision maker. A considerable amount of effort has been invested in briefing and re-briefing customer

¹ Based on an average HV load applied for of 764kVA since Jan 2011.

employees or agents. This has resulted in a much longer negotiation period than anticipated.

Agents acting on behalf of customers (eg IDNOs, ICPs, consultants, developers) often did not have an incentive to seek a C_2C solution. C_2C only benefits the end user, and not a customer's agent. On occasion this made it difficult to negotiate beyond the customers' agent and actually reach the key decision maker. We envisaged this was a potential issue, and in December 2012 we invited the key players in Electricity North West's connections market to an event, to introduce them to the C_2C concept. The event presented the benefits of the trial to our customers in two ways. It outlined the potential of a cost saving on a new or additional load connection, as well as the larger benefits to the future of the UK electricity industry. To encourage agents to seek a C_2C solution, we reminded them of the competition in Electricity North West's connections market, and suggested that it would be in their best interest to seek a C_2C solution when offered, with their customers to mitigate the risk of being outbid by a competitor.

- 2. Perceived impact of C₂C on customers with process operations For some customers with a manufacturing process, a failure of supply can often lead to the loss of revenue due to a break in their production. Process orientated customers were conscious that operating our network in a closed ring configuration, would potentially increase the number of fault events on their circuit. Some customers perceived that a disruption to their power supply, albeit of less than 3 minutes, could still result in the loss of production. For example, a customer may have lost one production day every three years prior to C₂C, and now may experience two lost production cycles. This presented a barrier to acceptance in some cases. Interestingly when questioned about their existing business continuity arrangements some customers said that they were nervous about the impact of increased short duration interruptions but did not have arrangements in place that reflected their sensitivity to loss of supply.
- 3. Managing customer's load When negotiating the prospect of a managed agreement with customers, a number had concerns about Electricity North West managing the physical disconnection of their managed load. Some customers have requested an option to be allowed to provide a given demand response within a certain timescale, instead of a pre-defined load control device being tripped automatically. In some instances we are willing to accept this, in particular where, as a last resort, there is a load control device that is controlled by Electricity North West that can be tripped should the customer not provide the agreed demand response in the agreed timescale.

Lesson 4: Analysing the effect of C₂C

Background: A key aspect of the Trial is the technical, economic and environmental assessment of C₂C. Our two academic partners; The University of Strathclyde and The University of Manchester are currently completing this analysis.

The technical work-package is validating the effect of new C₂C network configurations at distribution level and addition of post fault demand response loads on: (i) ability to release network capacity; (ii) electrical losses; and (iii) power quality.

The economic and environmental work-package is investigating how economically favourable the C_2C solution is and also the resultant carbon impact from the assets and the operations of the network under the proposed C_2C configuration.

Lesson Learned:

1. Technical: Analysis of the 36 closely monitored Trial ring networks, indicate that on average a potential doubling of network capacity for open and closed ring C₂C circuits can be achieved compared to the existing radial configuration. At the point where the

- network requires reinforcement or the implementation of a C_2C method to accommodate additional demand, the closing of the NOP to implement the closed ring C_2C configuration on average at peak demand will reduce losses by around 10%. When profiling the peak losses up to the capacity limit of the C_2C method, losses are on average greater than the typical reinforced network.
- 2. Economic: Using the enhanced CBA framework, results of the preliminary analyses conducted for different scenarios and network types indicate that the C₂C method can be a cost effective alternative to traditional reinforcement practices as it can result in significant network investment and social costs reductions. The solution has a higher potential to be economically attractive when: (i) when costly reinforcements can be deferred or averted (ii) social costs are considered (iii) demand growth is highly uncertain.

Lesson 5: Accommodating DSR in ER P2-6

Background: We have conducted a consultation to gather views on the ability of Engineering Recommendation P2/6 (ER P2/6) "Security of Supply" to recognize customer load management and demand side response (collectively termed DSR) and the requirement or otherwise for modification of ER P2/6 in the short term to explicitly include the effects of DSR. In December 2012 Electricity North West was granted derogation from P2/6 relating to the C_2C circuits for the duration of the Trial.

The consultation format included network simulations to develop scenarios to be used in workshops and consultation documents. Internal workshops were initially held with selected staff with varying levels of P2/6 knowledge. The staff were questioned and provided their views on scenarios. A consultation document was then developed as an output from the internal workshop and opened to third parties. External workshops involving other DNOs, IDNOs and NGET took place and attendees gave their view on various scenarios.

Lesson learned:

Our work indicates that there is a general consensus among network operators that P2/6 does not preclude the use of n-1 DSR to maintain compliance but policy changes should be made to make this clearer. Our view is that ETR130 should be changed in the short term to enable DSR to be used at an appropriate level. Our work indicates that there is support for an update to ETR130 to clarify the use of DSR and the management of system intact load levels in the short term. Subsequent to the consultation process we have issued a recommendation report. This report has undergone revision due to further discussions with DNOs regarding the question of whether DSR should be accounted for in Group Demand or Network Capacity. The proposed changes enable each DNO to select the Group Demand option or Network Capacity as long as this selection is justified. The changes are currently under a consultation set up by the GB distribution Code Review Panel which closed on 23 May 2014, and we expect the changes to ETR130 to be ratified by the Distribution Code Review Panel at its September 2014 meeting.

7 BUSINESS CASE UPDATE

We are not aware of any developments that have taken place since the issue of the Project Direction that affect the business case for the Project.

8 PROGRESS AGAINST BUDGET

The original Project Budget as defined in the Project Direction is shown in Appendix A.

Prior to the acceptance of the Project Direction we discussed with Ofgem the recategorisation of expenditure as our understanding of delivery methods had changed during the development of the Project initiation documentation. For example, we proposed to change our delivery approach by using our own labour for some activities rather than contractors. We accepted the Project Direction and agreed to inform Ofgem of the proposed changes within the Project Progress Report process. Appendix B details the proposed recategorisation.

Ofgem has approved this request and agreed that moving forward we should report expenditure in relation to the re-based Project Budget.

Actual spend to date compared to re-based Project Budget is summarised in table 8.1 below. The report includes expenditure up to and including 31 May 2014. Detailed projected expenditure at Project activity level can be found in Appendix C.

Table 8.1

Total Costs	7,590	9,596	2,006	8,741	10,275	1,534

Note 1: Re-based Project Budget as agreed by Ofgem on 24 January 2013

The actual spend to date is £7.6m, £2m favourable to Project Budget to date. The estimated at completion costs is forecast to be £8.7m, £1.5m favourable to Project Budget.

The current position shows the most significant contribution to this outperformance to date is due to £0.6m of efficiencies regarding remote control installation (£0.3m of this due to scope reduction²), £0.1m IT efficiencies and £0.6m of efficiencies against contingency. There is also a £0.2m outperformance of the connections design budget. Our estimated at completion forecast currently reflects these efficiencies.

9 BANK ACCOUNT

The Project bank statement is shown in Appendix D. The statement contains all receipts and payments associated with the Project up to the end of May 2014.

10 INTELLECTUAL PROPERTY RIGHTS (IPR)

Electricity North West is following the default IPR arrangements. We have considered our IPR approach to current period Project deliverables and concluded the default IPR arrangements apply.

² The Project Budget assumed the funding for the installation of 540 remote control units, in reality the Project was required to fund the installation of 489 units due to 51 units overlapping with, and being funded by our Quality of Supply investment programme.

11 OTHER

There is no other information at this time that would be of use to Ofgem in understanding the progress of the Project and performance against the SDRC.

12 ACCURACY ASSURANCE STATEMENT

This document has been reviewed by a number of key business stakeholders. The Project team and select members of the C_2C Project Steering Group, including the lead member of the bid development team have reviewed the report to ensure its accuracy. The narrative has also been peer reviewed by the Electricity North West Future Networks Manager and the Electricity North West Networks Strategy and Technical Support Director.

The financial information has been produced by the C₂C Project Manager and the Projects' finance representative who review all financial postings to the Project each month in order to ensure postings have been correctly allocated to the appropriate Project activity. The financial information has also been peer reviewed by the Electricity North West Distribution Finance Business Partner. Issue of the document has been approved by the Networks Strategy & Technical Support Director.
