The contents of this document may not be used for purposes other than that for which it has been supplied and may not be reproduced, either wholly or in part, in any way whatsoever. It may not be used by, or its contents divulged to, any other person whatsoever without the prior written permission of Electricity North West Limited.

## 1 Introduction

This specification covers the design and erection requirements of Low Voltage Insulated Aerial Bundled Conductors (LV ABC) and services employed on the overhead line network owned by Electricity North West Limited (Electricity North West). It is based on ENA TS 43-12 and also meets the requirements of the Electricity Safety, Quality and Continuity Regulations (refer to EPD101).

All new LV ABC overhead lines shall be designed and constructed to this specification. Refer to EPD473 for the policy governing the use of LV ABC lines in other circumstances, eg refurbishment and use in high risk areas. More detailed information on each of the topics included in this specification is given in CP420 Part 1 Chapter 24.

Electricity North West's engineering practice and procedures for constructing an LV ABC line are given in CP420 Part 1 and CP430 Part 1 respectively. Practice specific to refurbishment is covered in CP421.

LV ABC comprises insulated conductors bundled together. The insulation is made from cross-linked polyethylene (XLPE); the cross-links between the molecular polyethylene chains give the material additional strength and rigidity. The $A B C$ is supported and terminated in accordance with the General Arrangement (GA) Drawings included in this specification.

This system incorporates Protective Multiple Earthing (PME). Refer to CP332 and CP420 Part 1 Chapter 21 for more detail on PME.

This specification is basically split into four parts:

- The specification text, which provides the background information for the detail of the appendices.
- Appendix A, which contains GA Drawings with lists of materials.
- Appendix B, which contains a reference list of all materials quoted in Appendix A in alphanumeric order.
- Appendix C, which contains design data.

## 2 Scope

This specification covers the design and erection requirements for all LV ABC lines and associated services, including service flights and landings on buildings (but not LV mural wiring) and operating in the range up to and including 1 kV . LV mural wiring systems (systems attached to buildings) shall be designed and constructed to ES40004a.

The ABC lines used on the Electricity North West network comprise:

- Conductor, $\mathrm{ABC}, 2 \times 35 \mathrm{~mm}^{2}$
- Conductor, $\mathrm{ABC}, 3 \times 35 \mathrm{~mm}^{2}$
- Conductor, $\mathrm{ABC}, 4 \times 35 \mathrm{~mm}^{2}$

## Issue 3

December 2022

- Conductor, $\mathrm{ABC}, 5 \times 35 \mathrm{~mm}^{2}$
- Conductor, $\mathrm{ABC}, 2 \times 95 \mathrm{~mm}^{2}$
- Conductor, $\mathrm{ABC}, 3 \times 95 \mathrm{~mm}^{2}$
- Conductor, $\mathrm{ABC}, 4 \times 95 \mathrm{~mm}^{2}$
- Conductor, $\mathrm{ABC}, 5 \times 95 \mathrm{~mm}^{2}$
(Where $2 \times 35 \mathrm{~mm}^{2}$ denotes 2 wires bundled together, each of which contains one $35 \mathrm{~mm}^{2}$ effectively insulated conductor, etc.)

All the above conductors are specified in ES400C3.
Concentric service cables are covered in ES400C8.

## 3 Definitions

Definitions are as given in CP420 Part 1.

## 4 Design Criteria

### 4.1 General

A full set of design and construction data for each ABC type is given in Appendices C1 to C4. Design data for service spans (including concentric cables) are covered in Appendix C5, and a separate set of design data for unstayed supports is given in Appendix C6.

3 -wire or 5 -wire $A B C$ shall be treated as the equivalent 2 -wire or 4 -wire $A B C$. For example, for $A B C, 3 \times 35 \mathrm{~mm}^{2}$, refer to Appendix C1 (ABC, 2x35mm²).

The data are based on the GAs and materials included in this specification. Variations to the GAs for 3-wire and 5-wire ABC are covered in Section Error! Reference source not found.

NOTE: that the erection tables include creep at 10\%; the design tables do not include creep. The erection tables are for use by the linestaff. They are intended to be used in conjunction with a dynamometer or sag board.

### 4.2 Support Data

Stresses in unstayed intermediate supports are bending stresses caused by wind load on iced conductors equivalent to two service spans normal to the line. (Loading point $=300 \mathrm{~mm}$ below pole top.)

Unstayed capability of supports gives a minimum factor of safety (FoS) for all conductors of 2.5.
Stresses in stayed supports are crippling stresses caused by stay tension and conductor weight.
Strut capability of supports gives a minimum FoS for all conductors of 2.5.

Page 8 of 153
© Electricity North West Limited 2022

Poles/stays shall be selected in accordance with the data included in the relevant Appendix C .
These data are for poles without electrical plant. For poles supporting plant, strut loadings need to be considered and recalculated where necessary. (For this purpose, a 1000 kg weight can be approximated to 1000kgf of additional strut loading.)

### 4.3 Span Lengths

Recommended and maximum span lengths for each ABC/concentric cable type are given at the beginning of the relevant design data appendix.

Treat 3 -wire or 5 -wire $A B C$ as the equivalent 2 -wire or 4 -wire $A B C$. For example, for $A B C, 3 \times 35 \mathrm{~mm}^{2}$, refer to Appendix C1 (ABC, $2 \times 35 \mathrm{~mm}^{2}$ ).

### 4.4 Erection Data

Main lines shall be erected in accordance with the data in Appendix C1 to C4. Service spans shall be erected in accordance with the data in Appendix C5.

The data in the erection sag tables take account of the following:

- Loads on clamps shall not exceed $40 \%$ of breaking load, nor shall they be sufficient to damage the conductor insulation.
- The tension shall allow connections to be made to an ABC bundle under normal working conditions.

The tension shall be sufficient to maintain effective operation of anchor clamps and required clearances throughout the design temperature range.

## 5 Clearances

### 5.1 General Rules

The following rules shall be incorporated in the design:

- Clearances from external objects and structures shall comply with CP420 Part 1 Chapters 15 and 15A. The design sag tables (Appendix C), using the maximum operating temperature of $75^{\circ} \mathrm{C}$, shall be used to evaluate clearances.
- Line build clearances shall comply with CP430 Part 1 and CP420 Part 1 Chapter 15A.
- $\quad A B C$ shall not oversail roofs unless it is unavoidable. If it is necessary to oversail a roof, the relevant spans shall not contain any in-line connections.
- ABC shall not terminate within 0.5 m of any thatched roof.

### 5.2 Tree Clearances

The points listed below shall be considered where an $A B C$ system passes through trees. For detailed information on LV ABC tree clearances, refer to CP420 Part 1 Chapter 15.

- The possibility of abrasion of the ABC by branches, etc. Although there is a significant lateral reduction in the amount of tree-cutting for ABC (when compared with conventional open wire), the XLPE insulation shall not be allowed to come into contact with tree trunks, mature branches or heavy outer growth under any circumstances, due to its susceptibility to abrasion. Tree guard may be used to protect the ABC against abrasion as described in CP420 Part 1 Chapter 15. When tree guard is used, the tree clearances give in Chapter 15 do not apply. However, the ABC must be able to move vertically without the possibility of it resting on a branch or being forced up into a branch. Extensive application of tree guard over a span is not permitted: it will have a detrimental effect on sag and tension.
- Effects of the wind on conductor swing and sag.
- Effects of snow and wind loading on trees or branches bearing onto the $A B C$.
- The proximity of the trees providing unauthorised access for climbing.
- Provision shall be made to protect the conductor and pole supports by fitting weak links between the pole hook and the suspension clamp on in-line supports only where there is a danger of trees falling within the span. Weak link arrangements shall not be used on spans on either side of a road crossing, railway or navigable waterway.
- Where there is a danger that the $A B C$ may be used as unauthorised access (e.g. children attempting to access trees), the ABC shall be positioned outside the reach of all climbable limbs. If necessary, branches shall be removed with the owner's permission.

## 6 Erection Criteria

### 6.1 Systems Attached to Poles

Systems attached to poles shall comply with the relevant GA drawings and their associated lists of materials from Appendix A. Note that these arrangements include service connections and structures containing plant. Variations for 3 -wire and 5-wire ABC are covered in Section 6.6 below.

All fittings supporting the ABC system shall comply with this specification and shall provide an insulation barrier rated at 1000 V between the core insulation and the mechanical attachment.

The $A B C$ shall be attached in such a manner that it does not make direct or inadvertent contact with any steelwork or stays.

### 6.2 Pole to Building Flights

Flights from a pole to a building must be insulated where they are ordinarily accessible and at a suitable height where they are unlikely to be damaged, or where people going about their everyday activities cannot come into contact with them. A "suitable height" depends on what the flight is crossing and on the cable type.

Only concentric service cable or $A B C$ shall be used for new and replacement flights between pole and building.
Clearances shall comply with CP420 Part 1 Chapter 15 and 15A.
Landing points on buildings and the suitability of buildings to be used to support mural wiring systems shall be assessed in accordance with Section 6.3 below.

### 6.3 Systems Attached to Buildings

Systems attached to buildings shall comply with the relevant GA drawings and their associated lists of materials from Appendix A. Variations for 3-wire and 5-wire ABC are covered in Section 6.6 below.

Routing of $A B C$ shall take into account potential points of hazard to the installed system.
Proposed attachment points on buildings shall be inspected to ensure that, as far as is reasonably practicable, they are structurally sound and can support the ABC and fittings, given the rest of the requirements described in this section. Good quality brickwork or stonework should be adequate for the purpose. Therefore, brickwork, for example, shall be inspected for damage, signs of crumbling and loose (or lack of) mortar. If there is any doubt about the integrity of the proposed attachment points or supporting structure, they shall not be used to support the ABC. It is not acceptable for any type of fixing to be into a bargeboard or other wooden part of a building.

Mechanical loadings on a building shall not exceed 1.3 kN per fixing unless special precautions are taken. Preferably, fixings will be loaded in shear, not in tension. The approach angle of the $A B C$ to a building surface under load shall be minimised. Corners or other structural features can be used to achieve this. No system shall be constructed with full aerial tension acting directly on a building.

Refer to ES40004a for design and construction of LV mural wiring systems attached to buildings, i.e. wiring running along a building from a landing point. Note that ES40004a also covers underground fed LV mural systems.

### 6.4 Systems within Buildings

$A B C$ shall not be installed within buildings: it is not an all-insulated system.

### 6.5 Sectioning Points

Fuses shall be installed in positions such that the number of customers affected by loss of supply will be limited if sections of the $A B C$ need to be made dead.

### 6.6 Variations for 3-Wire and 5-Wire ABC

### 6.6.1 Types of 3-Wire and 5-Wire ABC Available

The following types of 3 -wire and 5-wire ABC are available:

- Conductor, ABC, $3 \times 35 \mathrm{~mm}^{2}-\mathrm{CC} 012105$.
- Conductor, $\mathrm{ABC}, 5 \times 35 \mathrm{~mm}^{2}-\mathrm{CC} 012108$.
- Conductor, $\mathrm{ABC}, 3 \times 95 \mathrm{~mm}^{2}$ - CC 012075.

Conductor, ABC, 5x95mm² - CC 012077.

### 6.6.2 General

Because the third or fifth wire (the earth wire) is the same size as the other wires in the effectively-insulated bundle, and because the earth wire will either be in tension or non-tension as per the other wires in the bundle, compression fittings will generally be the same as for the other wires in the bundle.

### 6.6.3

The additional earth wire shall be taken around the outside of any clamps as shown in GA Drawing Error! Reference source not found.. Because of the catenary support of the rest of the bundle, the earth wire will not be in tension, therefore, where necessary, non-tension compression fittings may be used as shown.

### 6.6.4 Effect on GA Materials of the Additional Earth Wire

At section poles where there is an anchor clamp (refer to Drawing Error! Reference source not found.):

- One additional non-tension compression fitting is necessary (same as CC as for other wires) where lengths of $A B C$ need to be connected.
- Additional cable ties are needed as shown.

In other cases, an earth wire shall be connected to another length of wire using the correct size of compression fitting as follows:

- Full tension fitting if the joint is in tension or non-tension fitting where there is slack, and the joint is not under tension.

Appropriate bimetallic fitting if wires are of different metals.

## 7 Supports

### 7.1 General

Supports shall be configured in accordance with the appropriate GA drawing. Wood poles used shall be manufactured and fabricated to ES400W2. All wood poles covered by this specification shall be either medium or stout. Refer to the relevant Appendix C for details of support type for each ABC configuration and arrangement.

Refer to CP421-4 for policy on third party attachments.

### 7.2 Foundations

Planting depths are given in Appendix C. Wood blocks shall be fitted to all section poles and terminal poles. Unstayed intermediate supports do not normally need wood blocks unless specified otherwise. One case where intermediate poles may need foundations is covered in Appendix C7 (Solutions to out-of-Balance Problems).

Excavation/backfill of pole holes is covered in CP420 Part 1 Chapter 03, and pole erection is covered in CP420 Part 1 Chapter 04.

Augering can be used, but only for intermediate poles, and only if the ground is suitable. An augered hole shall be 0.5 m deeper than the equivalent hand-excavated hole, hence a longer pole will be needed. After augering, the hole shall be backfilled with approved compaction material (refer to ES400R5).

### 7.3 Unstayed Angles (Including Service Attachments)

It is preferable to use stays for all angle poles, and stays shall be used where wayleaves for stays can be obtained. However, unstayed angle poles are allowed in accordance with Appendix C6, but not close to foundations, supporting walls or buildings.

### 7.4 Stayed and Transition Supports

All angle supports (intermediate and section) shall be supported by stays, except for the cases covered by Section 7.3 above. Refer to Section 8 for general stay information and the relevant Appendix C for stay spread and minimum stay angles.

All tee-off and terminal supports (excluding service attachments) shall be supported by stays. Refer to the relevant Appendix C for minimum stay angles.

Transition arrangements introduce out-of-balance problems, due to the differences between the $A B C$ and open wire conductors. Refer to Appendix C7 for solutions to out-of-balance problems.

## 8 Stays

Stay arrangements, including stay strand, insulators, pole top attachments and anchors, shall comply with CP420 Part 1 Chapter 07. The use of flying stays, struts and outriggers shall be avoided wherever possible.

A stay plate may be used as an alternative to a pole top makeoff for securing a stay to the pole. However, a light duty stay plate may only be used where the safe working load of the attached stay does not exceed 28 kN . For a structure of restricted height, the use of a stay plate may be preferable: the pole-top fixing to stay insulator distance is less for a stay plate than that of the equivalent pole top makeoff.

Only screw-in type or standard wooden 4-tonne stay blocks shall be used generally. Load lock anchors may be used, but calculations shall be done on a case-by-case basis to ensure that a minimum FoS value of 2.5 is maintained. The maximum working load for a load lock anchor is 28 kN .

NOTE: that the ideal stay angle (between pole and stay) is $45^{\circ}$. This angle can be varied between a minimum of $30^{\circ}$ and a maximum of $50^{\circ}$, however, in exceptional circumstances a minimum of $20^{\circ}$ can be considered, provided that the additional strut load imposed on the pole is taken into account.

In certain circumstances, where visibility of the stay may be a problem (e.g. hedgerow next to footpath), a stay marker to ES 400 H 2 shall be fitted to bring attention to the stay.

## 9 Conductor Erection

ABC conductors shall be erected in accordance with CP420 Part 1 Chapter 06. Because ABC has an XLPE covering, it is particularly important to ensure that the bundle is not in contact with the ground or any other potentially abrasive surfaces during stringing out.

Full tension joints are not permitted in new sections of LV ABC.

## 10 Material Requirements for the Erection of an ABC Line

### 10.1 Conductor

### 10.1.1 Standard for Manufacture and Delivery

LV ABC shall comply with ES400C3.

### 10.1.2 Identification of Phases, Neutral and Earth

Phases, neutral and earth are identified by ribs or no ribs on the insulation as follows:

Phase L1-1 rib
Phase L2-2 ribs
Phase L3-3 ribs
Neutral - fully ribbed
Earth - smooth (no ribbing)
It is important to ensure that the above phase/neutral/earth identification is maintained when $A B C$ tails are used in the construction of a GA.

### 10.2 Conductor Fittings

### 10.2.1 General

Conductor fittings for LV ABC systems shall comply with ES400C29 with the exception of helical fittings which shall comply with ES400H2.

It is important to ensure that the LV ABC is correctly secured to the fittings to ensure: even distribution of load; only insulated parts of the clamps are in contact with the LV ABC.

### 10.2.2 Suspension Clamp

Suspension clamps shall be used to carry the conductor on intermediate supports. The angles stated on the relevant GA drawings shall not be exceeded. These clamps incorporate rollers which are used during running out. For angles of line deviation exceeding $30^{\circ}$, but not exceeding $60^{\circ}$ (maximum angle for these clamps), extension rollers shall be fitted during running out to prevent snagging. These extension rollers shall be removed once the section has been terminated.

On supports where uplift could cause the clamp to slip off the supporting hook, the clamp can still be used in the following configuration provided that the vertical line deviation is less than $30^{\circ}$ : the clamp can be inverted and fixed in position by an M20 bolt. Alternatively, a section support can be used at that position.

### 10.2.3 Anchor Clamps

Anchor clamps are used on all section, terminal and tee-off supports to take the line tension. An anchor clamp is also used to secure the LV ABC service connection.

### 10.2.4 Insulation Piercing Compression Connectors

Insulation piercing compression connectors (IPCCs) shall be used as follows:

To make non-tension connections to the LV ABC, eg tee-off connections or service connections. IPCCs may be used as an alternative to non-tension compression connectors (see below).

Certain IPCCs contain a connector part enabling bare copper to be connected to ABC - these are specified on the appropriate GA Drawings.

The integrity of the insulation (electrical insulation, mechanical integrity and environmental protection) shall be maintained by the use of appropriate shrouds; these may be supplied with the IPCC. Special requirements for the use of IPCCs are included in Section 11.

### 10.2.5 Full Tension/Non-Tension Compression Connectors

Full tension or non tension compression connectors shall be used as necessary to maintain the continuity of the main line and earths. These connectors should not be needed on new lines except in the mandatory positions shown on the GA Drawings. IPCCs may be used as an alternative to non-tension compression connectors.

### 10.2.6 Helical Dead Ends

Helical dead ends shall be used to secure CNE, SCNE or open wire service connections only to the main line pole.

### 10.2.7 Weak Links

Weak links shall be fitted between the hook and suspension clamp on in-line supports only where it is considered necessary to protect the line as described in Section 5.2.

### 10.3 Poles

### 10.3.1 General

The material and fabrication of wood poles shall comply with ES400W2.

### 10.3.2 Pole Caps

Pole caps shall not to be fitted to poles.

### 10.4 Pole Fittings

### 10.4.1 General Fixing Details

Two 22 mm diameter pre-drilled holes, 150 mm apart, are provided on a standard LV ABC wood pole for securing the pole-top fittings.

### 10.4.2 Hook Bolt

The hook bolt, which comprises a pigtail hook with an integral M20 bolt, is used to support the suspension clamp. Hook bolts shall comply with ES400F1.

### 10.4.3 Outrigger Hook

The outrigger hook is used in place of the hook bolt to give the required additional clearance where the ABC is running through an inside angle, or to remove the need for angled arrangement. Outrigger hooks shall comply with ES400S11. There is a 22 mm hole in the integral supporting bracket of the outrigger hook.

### 10.4.4 Eye Nut and Eye Bolt

Eye nuts and eye bolts are used to support anchor clamps. The eye bolt comprises an eye, to take the anchor clamp, and an integral M20 bolt. The eye nut comprises the same eye as the bolt, but with an integral M20 nut. Eye nuts and eye bolts shall comply with ES400F1.

### 10.4.5 Fall-Arrest, Reliable Anchor Points

Fall-arrest, reliable anchor points (FARAPs) shall not be fitted, unless shown on the GA Drawing and/or list of materials. Where fitted, FARAPs shall comply with ES400S11.

### 10.5 Backfill/Compaction Material

Backfill/compaction materials shall comply with ES400R5.

### 10.6 Stay Materials

Material requirements of stay components are fully specified in CP420 Part 1 Chapter 07.

### 10.7 Service Cables

The following concentric service cables are covered by this specification:

- Split Neutral Earth (SNE) - in this case Split Concentric Neutral Earth (SCNE) - to ES400C8.
- Combined Neutral Earth (CNE) to ES400C8.

### 10.8 Fasteners and Washers etc

All fasteners (e.g. nuts, bolts, security ties) and washers used to secure the above components shall comply with ES400F1.

## 11 Electrical Connections

### 11.1 General

Full tension joints are not permitted on new $A B C$ lines.

Connections down the pole to earth electrodes are shown on applicable GAs. For further information on earthing refer to Section 13.

The integrity of the insulation (electrical insulation, mechanical integrity and environmental protection) at any $A B C$ bare end shall be maintained by the use of appropriate end caps.

ABC shall be secured to the pole by cleats, as necessary. All cleats shall comply with ES400C20.

### 11.2 Mains-to-Mains Connections

Non-tension connections shall be made using the IPCCs in accordance with the following rules and as specified on the GAs:

- $\quad$ Single phase $35 \mathrm{~mm}^{2}$ connections: one IPCC shall be used at each phase connection; one shall be used at each neutral connection.
- Single phase $95 \mathrm{~mm}^{2}$ connections: one IPCC shall be used at each phase connection; two shall be used at each neutral connection.
- All three phase connections: one IPCC shall be used at each phase connection; two shall be used at each neutral connection.
- At network isolation points, section fuses shall be used as shown on the relevant GA drawings. IPCCs shall not be used at these positions.

### 11.3 Service Connections

One IPCC shall be used for each service connection as shown on the relevant GA. (Note that a $95 \mathrm{~mm}^{2} \mathrm{ABC}$ service shall be treated as a mains-to-mains connection above, i.e. two IPCCs shall be used on the neutral earth.) The following general rules shall be followed:

- The cable termination break-out kits shall be used to terminate CNE and SCNE cables at the pole as shown on the appropriate GA drawing. Details of the break-out kits are included in CP411 LV.
- Non-standard service cable: a phase balance shall be maintained on the main where possible; heatshrink sleeving shall be applied to the stranded neutral prior to connection.
- A security tie shall be used to secure the service conductor to the bundle to avoid eventual failure due to hardening.
- The integrity of the insulation (electrical insulation, mechanical integrity and environmental protection) where $A B C$ insulation is pierced for connection shall be maintained by the use of appropriate shrouding or tape; the protection applied shall allow for any insulation retraction.
- If it is necessary to remove an IPCC, the integrity of the insulation (electrical insulation, mechanical integrity and environmental protection) shall be maintained by suitable self-amalgamating tape. Note that an IPCC shall not be applied where an IPCC has been previously removed.
- If more than four connections (i.e. two single phase services or one three phase service) are needed, or there is a reasonable likelihood that they will be needed in future, connection to the bundle shall be via a distribution box as shown in Drawing l-40004-GA-016. Note that it is mandatory to connect the distribution box neutral down the pole to a separate earth electrode.
- For 3- and 5-wire $\operatorname{ABC}$ (SCNE), a separate earth may be run down the pole from the distribution box where considered necessary.

### 11.4 Mains Cable Termination and Connection to ABC

Cables shall be terminated on ABC poles in accordance with the jointing procedures in CP411LV. Refer to the appropriate GA drawing for connection details between the cable termination and the overhead line. All compression fittings, lugs and IPCCs shall comply with ES400C29.

## 12 Auxiliary Equipment (Including Fuses)

Connections to plant and fuses are shown on the relevant GA drawings. Transformers shall comply with ES321. Multi-service distribution boxes and fuses shall comply with ES400L6. Fuse-links shall comply with ES334. Regulators shall comply with ES325.

Connections between ABC tails and copper cores shall be via bimetal transition compression connectors (refer to ES400C29).
$A B C$ shall be connected to ancillary equipment at balancer and regulator supports (refer to the associated GA drawings) via $A B C$ tails.

All bare metal connections shall be fully shrouded to maintain the integrity of the insulation (electrical insulation, mechanical integrity and environmental protection).

LV fuses shall be installed not less than 3 m above the datum line, or 500 mm above an anti-climbing device (ACD) if one is fitted. In most cases, the datum line will be ground level. However, the datum line (and thus the fixing height) shall be adjusted to take account of any walls, fences, etc, within 1.5 m which could be used for unauthorised climbing. Additionally, fuses installed below 4.3 m shall have a fuse holder or blank in place (ie no bare metal to be left visible/accessible).

## 13 Earthing

### 13.1 General

Protective multiple earthing (PME) is covered in CP332.
PME electrodes shall be connected to those poles identified in accordance with the rules given in CP420 Part 1, Chapter 21. The connections from the bundle down to earth electrode(s) shall be in accordance with the relevant GA Drawings. The number of buried electrodes is determined by the method given in CP420 Part 1, Chapter 21.

Mandatory and non-mandatory earths are indicated on the GA drawings.
Generally, earth wires shall be run down the side of the pole opposite that on which neutral IPCCs, fuses, etc are fitted. Cables running down the pole shall be kept as far apart on the pole as possible and shall be run down the pole in a straight line as close to vertical as possible.

Earthing components shall comply with ES400E8.
CP420 Part 1 Chapter 21 covers conversion of earthing systems.

### 13.2 Earthing of Supports Carrying BT Attachments

BT attachments shall be earthed in accordance with Engineering Recommendations PO5/1 and EB/BT2.

### 13.3 Retention of Guard Wires

The guard wire shall be retained where an ABC system replaces an open wire system crossing under an HV system.

## 14 Cable Guards

All cables running down the pole, ie underground cables and earths, shall be protected by appropriate cable guards as specified in ES400G1. Clearances shall be as specified in CP420 Part 1 Chapter 15A.

## 15 Signing

Although there is no legislative requirement to fit danger-of-death notices to LV poles carrying effectively insulated conductors, it is Electricity North West's policy to fit two danger-of-death notices to all poles as detailed in CP420 Part 1 Chapter 09, such that a warning is visible from any direction of approach.

Other notices shall be fitted as specified in CP420 Part 1 Chapter 09.

## 16 Anti-Climbing Devices

Although there is no legislative requirement to fit anti-climbing devices to LV poles supporting LV lines, it is Electricity North West's policy to fit enhanced ACDs to poles classified as high risk and have cables or climbing aids, or there is evidence of unauthorised pole climbing. The enhanced ACD shall be fixed at 2.75 m above the datum line in accordance with CP420 Part 1 Chapter 10. (The datum line is as defined in Section 12 above.)

## 17 Agreements with third Parties

In cases where LV ABC lines are erected in close proximity to other bodies' plant or infrastructure, e.g. telecommunications equipment or railway infrastructure, the provisions of any joint agreements shall be followed. Clearances relating to joint agreements are covered in CP420 Part 1 Chapter 15. Joint agreement documents are listed in CP420 Part 1 Chapter 15.

## Rules for Use

1. The pole top extension can also be used on poles carrying $A B C$.
2. No more than two extension brackets shall be fitted per pole.
3. There shall be no more than one service per extension bracket.
4. These brackets are only to be used for single phase concentric cables - either CNE or SNE.
5. The use of these brackets does not change the maximum span.

## Notes

* Select appropriate item (size, type, etc...) from the specification in the adjacent "ES Ref" column.

## Appendix C

## C1 Design Data for Conductor, ABC, $2 \times 35 \mathrm{~mm}^{2}$

## Recommended Span 70m

## NOTE:

A FoS value of 2.5 is used on Stays, Windspan, Foundation and Single Pole Strut loading Capabilities.

A maximum Span of 70 m is allowed.

## C2 Design Data for Conductor, ABC, $4 \times 35 \mathrm{~mm}^{2}$

## Recommended Span 70m

## NOTE:

A FoS value of 2.5 is used on Stays, Windspan, Foundation and Single Pole Strut loading Capabilities.
A maximum Span of 70 m is allowed.

| 75 | * | 0.19 | 0.29 | 0.42 | 0.57 | 0.74 | 0.94 | 1.16 | 1.4 | 1.67 |
| 80 | * | 0.19 | 0.29 | 0.42 | 0.57 | 0.75 | 0.95 | 1.17 | 1.41 | 1.68 |

* Tensions are not given in the above table due to the fact that sags are given for both 2 core $A B C$ and 4 core $A B C$ of the same conductor size. It is extremely unlikely that a service span would be sagged by using a dynamometer.

These figures are based on the maximum loading on a building not exceeding 1.3 kN per fixing as stated in Section Error! Reference source not found.

Max span length for single phase $=30 \mathrm{~m}$.
Max span length for three phase $=20 \mathrm{~m}$.

Max span length for three phase $=20 \mathrm{~m}$.

## C5.2 Service, Pole-To-House, Concentric, Cu, Single Phase, 25mm²

## C5.2.1 Summary Data

Recommended Span 20m.
A FoS value of 2.5 is used on Stays, Windspan, Foundation and Single Pole Strut Loading Capabilities. A maximum Span of 30 m is allowed. Maximum Working Tension (MWT) $=1.3 \mathrm{kN}(132.5 \mathrm{kgf})$.

## C6 Design Data for Unstayed Supports

## Table 1: In-line Support with Service Span Attachments

In the table below, the effect of the unbalanced loading imposed by a single service span attachment has been converted to an equivalent addition to the actual wind loading span of the main line conductor.
The required pole size shall be determined by adding the actual main line wind loading span to the addition below. The pole shall be selected from the appropriate main line conductor table.
(It has been assumed that wind loading affects only the main line conductor; the service span being at right angles to the main - the latter then having a MWT based on ice loading with no wind.)

|  | Service |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Main | $2 \times 35 \mathrm{~mm}^{2}$ | $4 \times 35 \mathrm{~mm}^{2}$ | $2 \times 95 \mathrm{~mm}^{2}$ | $4 \times 95 \mathrm{~mm}^{2}$ |
| $2 \times 35 \mathrm{~mm}^{2}$ | 45 m | - | - | - |
| $4 \times 35 \mathrm{~mm}^{2}$ | 33 m | 59 m | 38 m | - |
| $2 \times 95 \mathrm{~mm}^{2}$ | 35 m | - | 39 m | - |
| $4 \times 95 \mathrm{~mm}^{2}$ | 24 m | 44 m | 28 m | -23 m |

Table 2: Angle Support with no Service Span Attachments (Medium Poles)

Unstayed angle supports shall have one 1.3 m foundation block fitted at 0.5 m below the ground line.
Allowed maximum line deviation angles have been calculated based on the worst case wind loading span capability for medium or stout grades of pole, with pole top horizontal loadings due to MWT and line deviation angle converted to an equivalent wind loading span.
Maximum angle of line deviation for stated LV ABC main line conductor size on medium poles for wind loading spans:

|  | Up to 40 m | $41 \mathrm{~m}-50 \mathrm{~m}$ | $51 \mathrm{~m}-60 \mathrm{~m}$ | $61 \mathrm{~m}-70 \mathrm{~m}$ | $71 \mathrm{~m}-80 \mathrm{~m}$ | $81 \mathrm{~m}-90 \mathrm{~m}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $2 \times 35 \mathrm{~mm}^{2}$ | $46^{\circ}$ | $44^{\circ}$ | $42^{\circ}$ | $40^{\circ}$ | not allowed | not allowed |
| $4 \times 35 \mathrm{~mm}^{2}$ | $31^{\circ}$ | $29^{\circ}$ | $27^{\circ}$ | $25^{\circ}$ | not allowed | not allowed |
| $2 \times 95 \mathrm{~mm}^{2}$ | $23^{\circ}$ | $22^{\circ}$ | $20^{\circ}$ | $19^{\circ}$ | $18^{\circ}$ | $16^{\circ}$ |
| $4 \times 95 \mathrm{~mm}^{2}$ | $7^{\circ}$ | $7^{\circ}$ | $6^{\circ}$ | $5^{\circ}$ | $4^{\circ}$ | $3^{\circ}$ |

LV ABC OVERHEAD LINES AND SERVICES
ES40004

Table 3: Angle Support with no Service Span Attachments (Stout Poles)

Maximum angle of line deviation for stated LV ABC main line conductor size on stout poles for wind loading spans:

|  | Up to 40 m | $41 \mathrm{~m}-50 \mathrm{~m}$ | $51 \mathrm{~m}-60 \mathrm{~m}$ | $61 \mathrm{~m}-70 \mathrm{~m}$ | $71 \mathrm{~m}-80 \mathrm{~m}$ | $81 \mathrm{~m}-90 \mathrm{~m}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $2 \times 35 \mathrm{~mm}^{2}$ | $62^{\circ}$ | $60^{\circ}$ | $58^{\circ}$ | $56^{\circ}$ | not allowed | not allowed |
| $4 \times 35 \mathrm{~mm}^{2}$ | $42^{\circ}$ | $40^{\circ}$ | $38^{\circ}$ | $36^{\circ}$ | not allowed | not allowed |
| $2 \times 95 \mathrm{~mm}^{2}$ | $32^{\circ}$ | $31^{\circ}$ | $29^{\circ}$ | $28^{\circ}$ | $26^{\circ}$ | $25^{\circ}$ |
| $4 \times 95 \mathrm{~mm}^{2}$ | $11^{\circ}$ | $10^{\circ}$ | $9^{\circ}$ | $8^{\circ}$ | $7^{\circ}$ | $7^{\circ}$ |

Table 4: Angle Support with One Service Span Attachment (Medium Poles)

Unstayed angle supports shall have one 1.3 m foundation block fitted at 0.5 m below the ground line.
Allowed maximum line deviation angles have been calculated based on the worst case wind loading span capability for medium or stout grades of pole, with pole top horizontal loadings due to MWT and line deviation angle converted to an equivalent wind loading span.

A single service span attachment within the included angle of deviation is assumed.
Maximum angle of line deviation with one service span attachment for stated LV ABC main line conductor size on medium poles for wind loading spans:

|  | Up to 40 m | $41 \mathrm{~m}-50 \mathrm{~m}$ | $51 \mathrm{~m}-60 \mathrm{~m}$ | $61 \mathrm{~m}-70 \mathrm{~m}$ | $71 \mathrm{~m}-80 \mathrm{~m}$ | $81 \mathrm{~m}-90 \mathrm{~m}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $2 \times 35 \mathrm{~mm}^{2}$ | $37^{\circ}$ | $35^{\circ}$ | $33^{\circ}$ | $31^{\circ}$ | not allowed | not allowed |
| $4 \times 35 \mathrm{~mm}^{2}$ | $19^{\circ}$ | $17^{\circ}$ | $15^{\circ}$ | $13^{\circ}$ | not allowed | not allowed |
| $2 \times 95 \mathrm{~mm}^{2}$ | $18^{\circ}$ | $16^{\circ}$ | $15^{\circ}$ | $13^{\circ}$ | $12^{\circ}$ | $11^{\circ}$ |
| $4 \times 95 \mathrm{~mm}^{2}$ | $3^{\circ}$ | $2^{\circ}$ | $2^{\circ}$ | not allowed | not allowed | not allowed |

## Table 5: Angle Support with One Service Span Attachment (Stout Poles)

Maximum angle of line deviation with one service span attachment for stated LV ABC main line conductor size on stout poles for wind loading spans:

|  | Up to 40 m | $41 \mathrm{~m}-50 \mathrm{~m}$ | $51 \mathrm{~m}-60 \mathrm{~m}$ | $61 \mathrm{~m}-70 \mathrm{~m}$ | $71 \mathrm{~m}-80 \mathrm{~m}$ | $81 \mathrm{~m}-90 \mathrm{~m}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $2 \times 35 \mathrm{~mm}^{2}$ | $53^{\circ}$ | $51^{\circ}$ | $49^{\circ}$ | $47^{\circ}$ | not allowed | not allowed |
| $4 \times 35 \mathrm{~mm}^{2}$ | $31^{\circ}$ | $29^{\circ}$ | $27^{\circ}$ | $25^{\circ}$ | not allowed | not allowed |
| $2 \times 95 \mathrm{~mm}^{2}$ | $26^{\circ}$ | $25^{\circ}$ | $24^{\circ}$ | $22^{\circ}$ | $21^{\circ}$ | $19^{\circ}$ |
| $4 \times 95 \mathrm{~mm}^{2}$ | $7^{\circ}$ | $6^{\circ}$ | $5^{\circ}$ | $4^{\circ}$ | $3^{\circ}$ | $2^{\circ}$ |

## C7 Solutions to Out-of-Balance Problems

## C7.1 Forces Involved and pole Considerations

Refer to Table 1 below for the forces applied to the pole at an open-wire/ABC transition, and for unstayed forces that can be applied to different pole sizes and types.

Existing intermediate poles do not need wood foundation blocks, but any replacement must have them fitted. Any terminal poles, either existing or new, must have foundation blocks fitted if they are to be used unstayed.

## C7.2 Options for Solving an Out-of-Balance Problem

If wayleaves and space permit, out-of-balance stays shall be used.
If wayleaves and space restrict the use of out-of-balance stays, then the out-of-balance issue may be resolved by adjusting tensions by not more than $10 \%$. Note, by adjusting tensions this will alter the sag which may cause another clearance issue.

If the above solutions are impractical, the following methods shall be considered:

- Unstayed pole (consider changing the pole to a stout or extra stout, if required)
- Extending the ABC to a stayed pole.
- Erecting a larger size of $A B C$ to reduce the out-of-balance force.

LV ABC OVERHEAD LINES AND SERVICES
