Our smart grid development

electricity
north west

Bringing energy to your door

Leading work on developing smart solutions

Deliver value
from existing
assets

Customer choice

Five flagship products (second tier/NIC) £42 million

C2C

SMART STREET

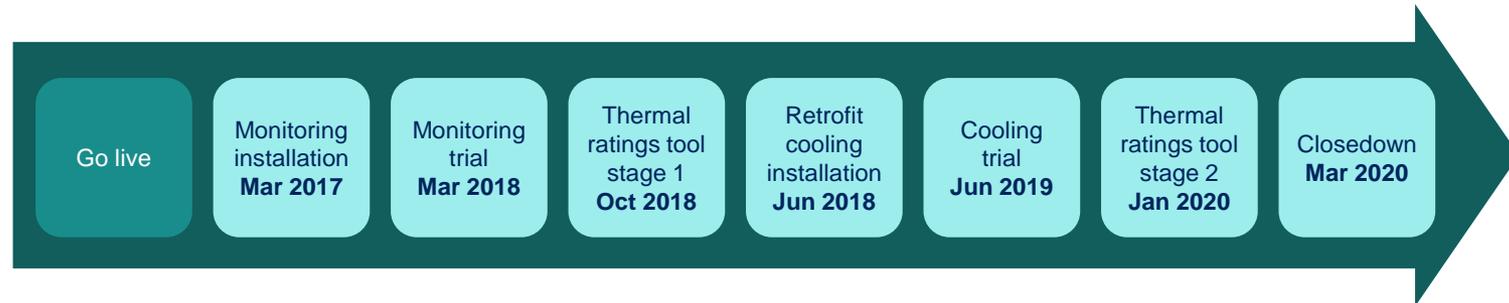

Celsius

CLASS

RESPOND

Awarded: 9 December 2015

 Investment	£5.5 million	Up to £583m across GB by 2050	 Financial benefits
---	---------------------	--------------------------------------	---

Partners and roles on project

electricity

Bringing energy to your door

ASH
CREATIVE WIRELESS ELECTRONICS

Supply complete retrofit monitoring solution.

Provide ongoing support throughout installation, commissioning and operation of the retrofit thermal monitoring workstream

RICARDO

Analyse trial data.
Develop methodology to understand relationship between asset temperature, load characteristics and surrounding environment

Determine impact of cooling technologies
Develop tool and spec for low cost temperature sensor
Recommendations for BAU rollout

UK Power Networks
Delivering your electricity

Work with Ricardo-AEA and Electricity North West to develop site selection methodology, installation plan and guide for future retrofit thermal monitoring solution

Participate in evaluation and selection of retrofit cooling techniques

Impact Research

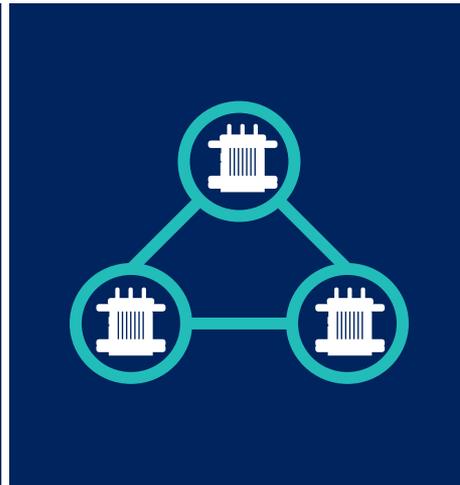

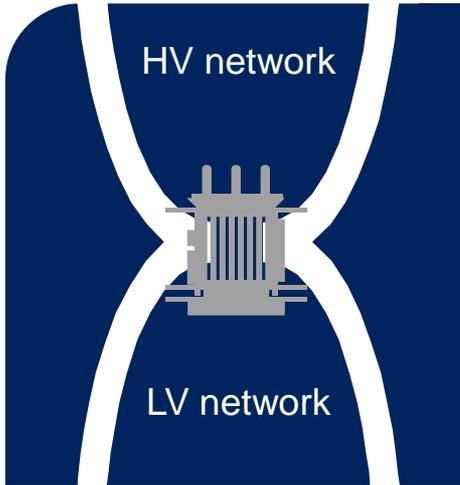

Lead the customer survey engagement.

UNIVERSITY OF
Southampton

Peer review of the analysis methodology of the retrofit temperature sensor part of the project

An investigative study on the impact of Celsius on the lifetime health of network assets

The problem

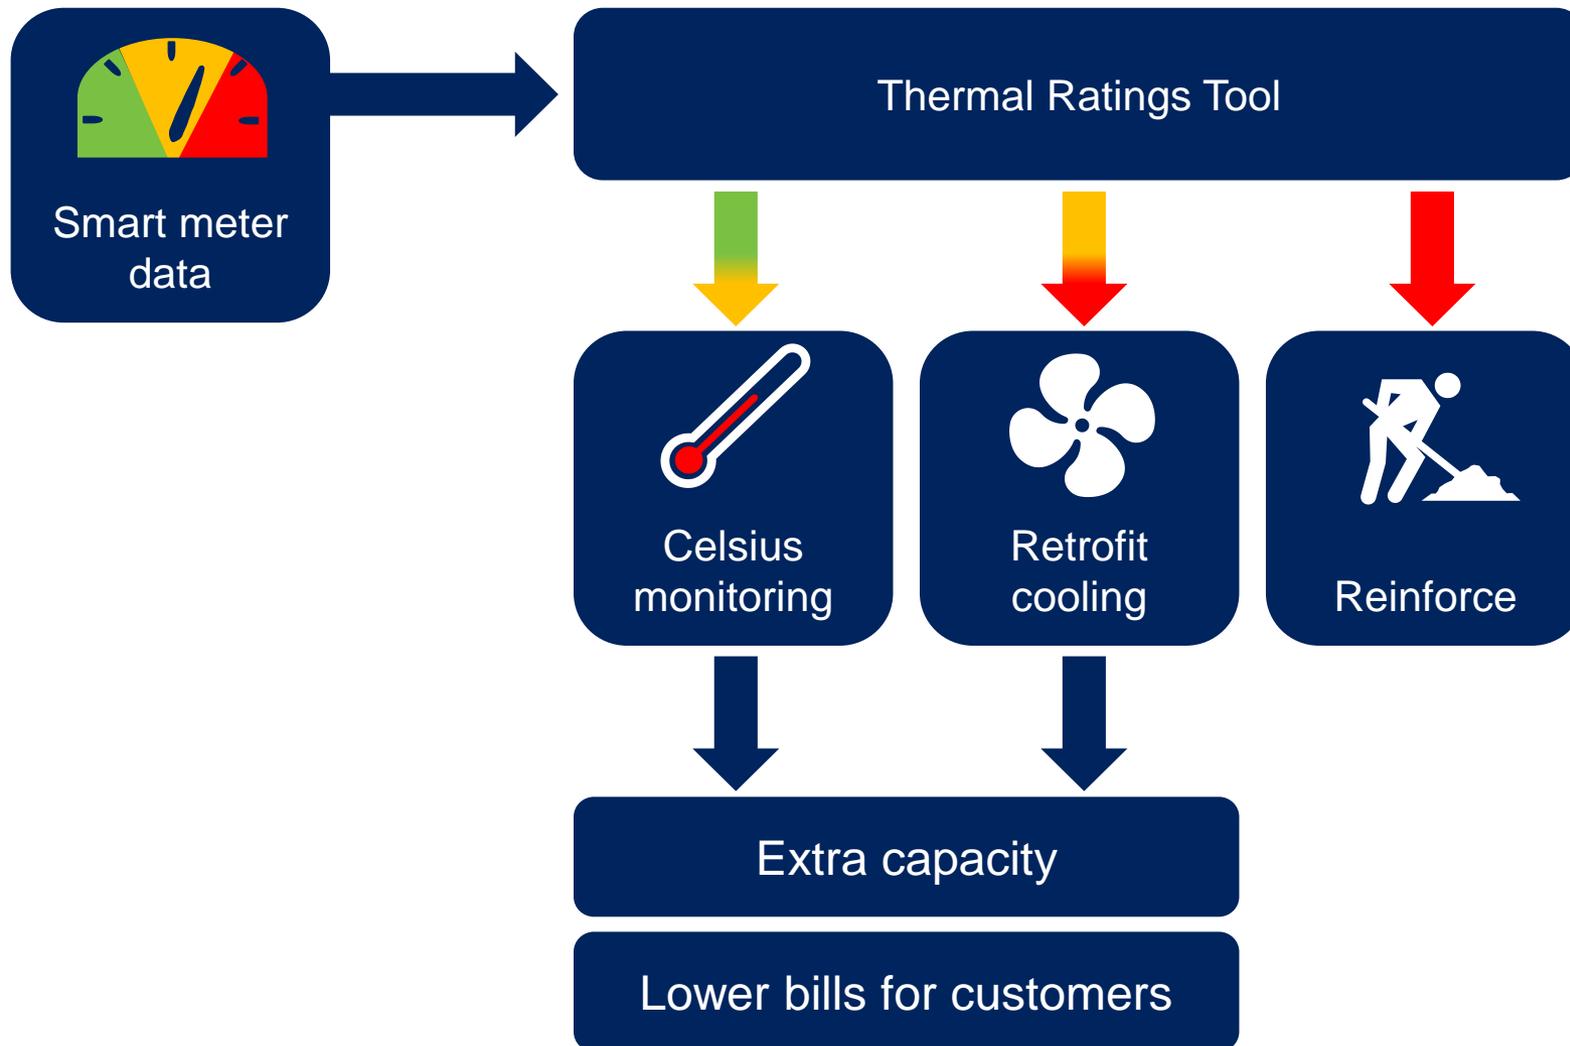

Objective is to maximise power through transformer

Assets have nominal thermal rating
Ratings = °C
Ratings \neq amps

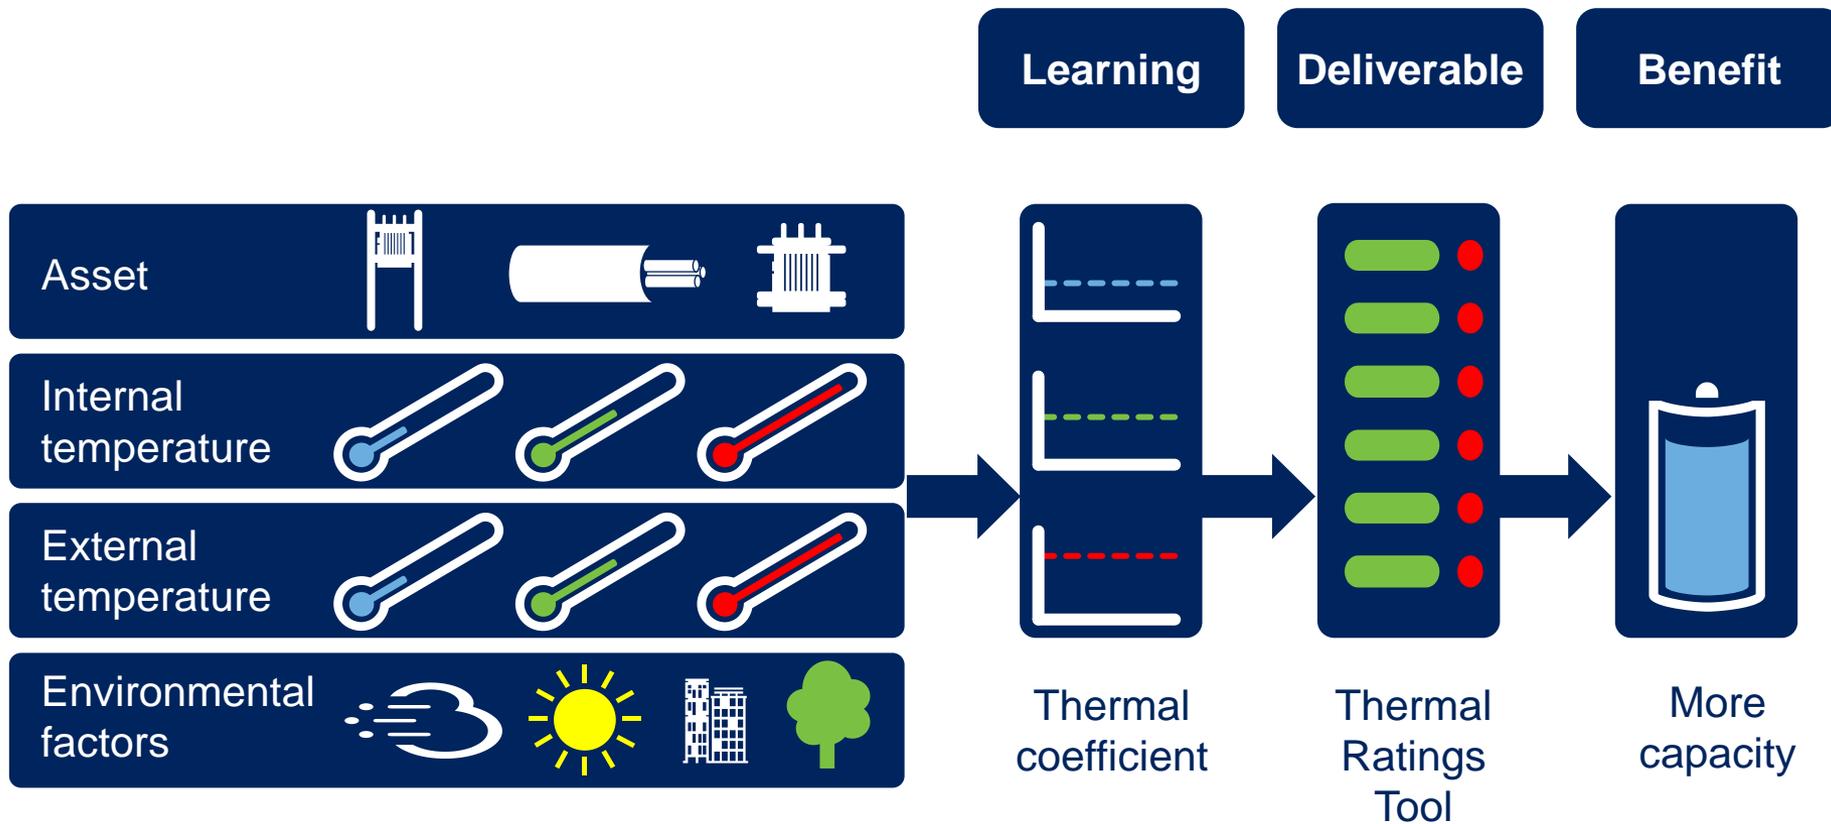

Diverse range of environments
Small changes in environmental factors can result in very different actual ratings

Assumed thermal ratings can lead to capacity being under-utilised or unnecessary risk

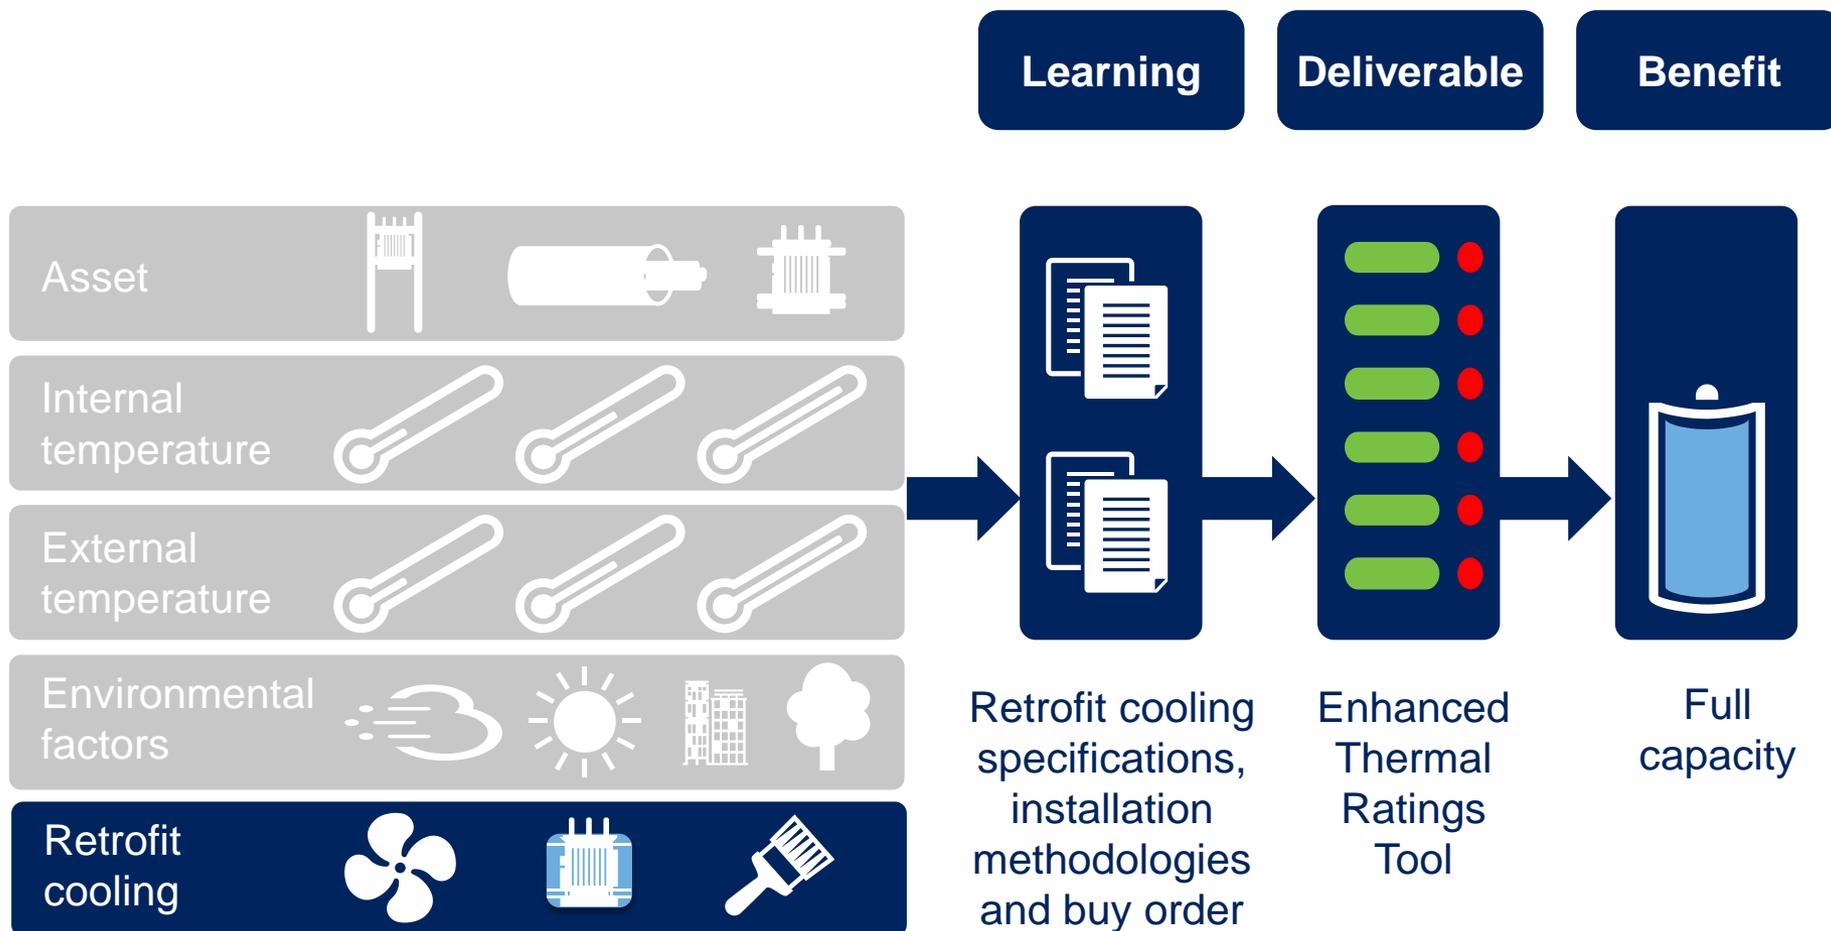

Celsius as part of the smart future

Step 1: Fit thermal monitoring

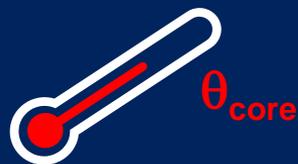

Step 2: Retrofit cooling

Thermal analysis (step 1)

Internal asset
temperature

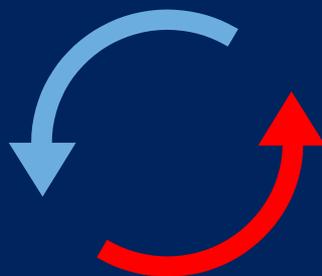

Thermal
coefficient

External asset
temperature

Thermal flow study (steps 1 & 2)

Research into heat and air flows for
optimal substation design

Asset health study (steps 1 & 2)

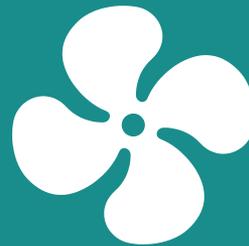

Examines effects of increased load
and cooling techniques on assets

Monitoring site selection and timescales

520 substations

Enough substations to represent 80% of GB substation population

100 cooling technique sites

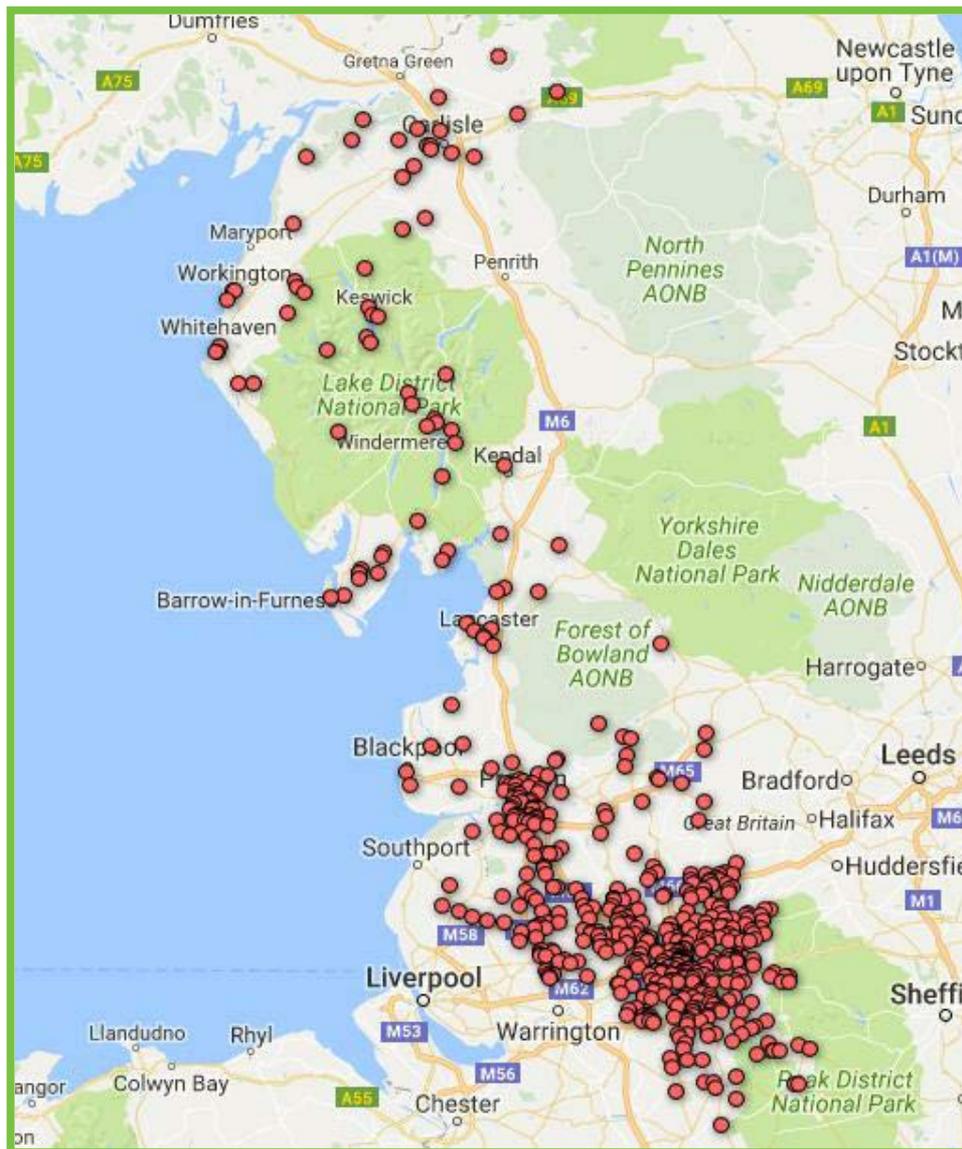

Subset of 520 substations – enough sites to adequately trial all techniques

Four year project

To enable trials to take place during all seasons and to trial all cooling techniques

Site selection map

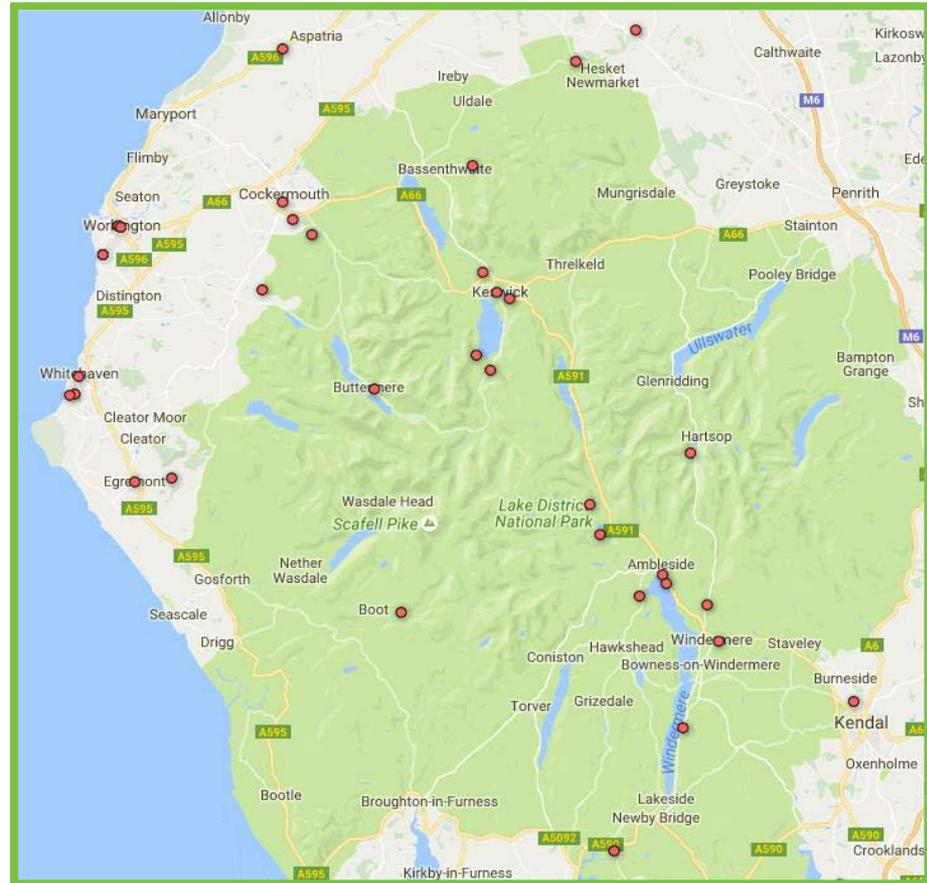

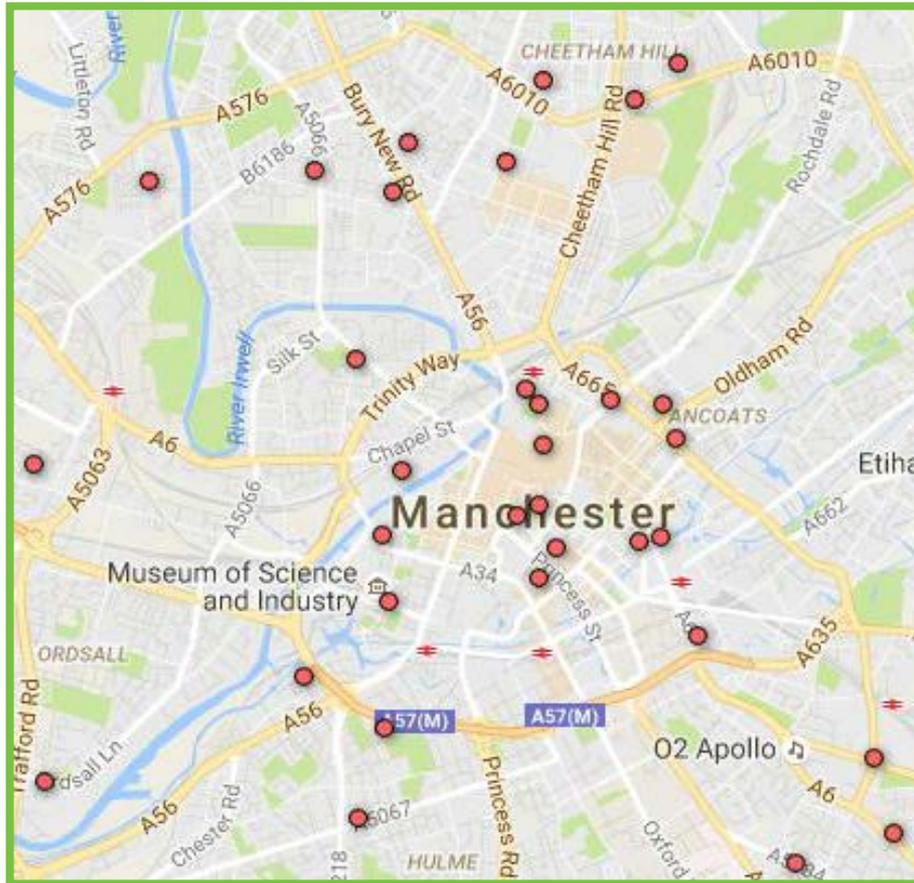

Site selection – rural and urban

Bringing energy to your door

LV board with three sensors

Transformer singles

Ventilation

Transformer

Traditional reinforcement v Celsius

	Traditional	Celsius
	Traditional replacement of ground-mounted transformer is expensive	Low cost options to release capacity as and when required
	Complex and time-consuming	Simple and quick to deploy
	Highly disruptive	Minimal or no disruption to customers

Customer engagement

electricity
north west

Bringing energy to your door

Customers in the Celsius trial areas will find the implementation of innovative retrofit cooling techniques as acceptable as traditional reinforcement

Customers who are educated as to the need for and benefits of Celsius are significantly more likely to find it acceptable

Customer engagement

Post event feedback

	Strongly disagree	Slightly disagree	Neutral	Slightly agree	Strongly agree
Today's webinar was successful in raising my understanding of the Celsius project				57%	43%
Webinars are suitable channels for communicating innovation project outcomes and are more convenient than attending an event in person.				14%	86%
I will take part in other webinars organised by Electricity North West to discuss low carbon projects.				29%	71%
Do you have any comments or suggestions about how we could have improved today's webinar?	<p>1. Have you considered increasing noise levels by installing fans? 2. Have you considered Air handling units? 3. The project may release some capacity in the transformer but that suggest cables will be stressed by increased load. Will there be any monitoring of thermal impact on cables. 4. Experience suggests temperature raise in the core of transformer can not be monitored by top and bottom sensors. How will you monitor that?</p>
